

QlikView 6 Enterprise

QlikView Enterprise is a fully capable developers' tool that lets your company's IT staff build and modify QlikView applications. Rather than confining companies to rigid, pre-defined templates, Enterprise gives companies the flexibility to modify and expand analytical applications to meet changing business requirements, and to quickly build and deploy new applications tailored to their unique organizational requirements.

Easy-to-Learn, Quick to Deploy

QlikView Enterprise gives customers the flexibility to develop their own analytical applications tailored to their data environments and business requirements. QlikView customers can use Enterprise to build powerful analytical applications for the whole range of business functions – including finance, logistics, inventory management, business performance monitoring, and more.

Combine data types and sources on the fly

Developers can load data from any ODBC or OLEDB enabled data source, text, and spreadsheet files. Data from disparate sources is easily combined into single applications containing millions of records down to the transaction level. QlikView Enterprise includes more than 150 functions to aggregate, manipulate, and conditionally process incoming data.

Object-based User-Interface Development

With the data loaded, developers can quickly build complete analytical applications. QlikView Enterprise's object-based development environment makes it easy to build analytical dashboards, charts, graphs, list boxes, text boxes and pivot tables that update automatically and provide comprehensive drill-down capability.
